

Remote pile driving monitoring

Pile Dynamics, Inc., introduced PAX, a new model of its Pile Driving Analyzer (PDA). The PAX is portable, battery operated, and weighs 10 pounds. Its display doubles as its control panel and keyboard, and has high visibility in all lighting conditions. Remote data transmission capability via broadband Internet allows firms to keep engineers in the office, send only the instrument to the job site, and use the PDA software (PDA-W) to monitor the load test. An office computer running PDA-W and receiving data gives the engineer the ability to perform comprehensive monitoring and analysis in real time. In local mode, the PAX performs as a full-capability PDA coupled with a full-capabilities personal computer.
