

PDA OFFERS TWO CONVENIENT MODES

The PAX is a lightweight, portable, battery-operated Pile Driving Analyzer® (PDA). When used in its remote data transfer mode, it offers the field crew a simple software interface and straightforward mode of operation. The engineer can receive data and perform comprehensive monitoring and analysis in real time with the PDA software (PDA-W), all while remaining in the office. In its local mode, the PAX doubles as a fully-capable PDA and personal computer. It gives the field engineer access to all variables of interest in real time and links directly to the latest version of CAPWAP, the dynamic test data interpretation software.
