

Pile Dynamics Develops Cross Hole Analyzer

Pile Dynamics, Inc., an ADSC Associate Member firm, headquartered in Cleveland, Ohio, recently announced that they have launched a small, yet powerful, Cross Hole Analyzer (CHA) for quality assurance of drilled shafts.

The device retains all testing functionality of the previous CHA model at one third of its size and half its weight. It also incorporates the touch-screen technology that is so popular with users of Pile Dynamics' other foundation testing instruments. This new CHA model features a sampling rate that is twelve times higher, resulting in superb data acquisition, and a battery that may last through an entire day of testing.

Testing accessories were also

enhanced and now include shorter probes in brass housing, cables that are stronger and detachable, and an improved depth encoder wheel. The smaller CHA and all its probes and cables fit in one single carrying case, making it easier to transport to the job site.

Pile Dynamics, Inc. is a global manufacturer of quality assurance systems for the deep foundations industry. For more information visit www.pile.com.
