

Foundation data transmission

The PAX piledriving analyzer (PDA) is portable, battery-operated and weighs 10 lb. Its display serves as its control panel and keyboard and the unit has good visibility under all lighting conditions. A special feature is remote data-transmission capability via broadband Internet. Engineers can stay in the office while the on-site device uploads test data to a desktop computer. The remote mode has a simple

software interface and straightforward mode of operation suitable for field crews. The PAX local mode serves as a fully capable PDA, giving the field engineer access to all data of interest in real time.
