REDESIGNS AUTOMATED MONITORING EQUIPMENT FOR ACIP / CFA PILES

Pile Dynamics, Inc. (PDI) has launched a new model of the Pile Installation Recorder (PIR), its popular instrument for monitoring installation of augered cast-in-place, continuous flight auger and drilled displacement piles. PDI has kept all the features that make the PIR compliant with the Geotechnical Circular number 8 from the US Federal Highway Administration (FHWA GEC 8), while introducing several improvements.

The new PIR displays the incremental grout volume and other variables that are essential for QA/QC on a much more visible screen – it is larger, in color, sunlight readable and back lit. A red / green indicator makes it easier for the operator of the drilling rig to maintain the target auger withdrawal rate. The grout volume data comes from a magnetic flow metre and depth readings from a depth measurement unit is now wireless and much smaller and

lighter. Auger rotation data is also sent to the PIR via a wireless transmitter. The absence of cables makes installation quicker and

simpler. Data retrieval from the PIR is via USB memory stick. The PIR still maintains the ability to print an installation record in the field. Pile Dynamics is offering the instrument for sale or rental, and so far has heard very positive feedback from the piling contractors that have tried the new PIR.

Apart from the Pile Installation Recorder, Pile Dynamics produces several other quality assurance and quality control products for the deep foundations industry. The company is located

in Cleveland, Ohio, and has commercial representatives in all continents.
