

ANALYZER UPGRADES ENHANCE TESTING

Pile Dynamics, Inc., has upgraded its Pile Driving Analyzer model PAK to incorporate technological developments that enhance foundation testing. It now features a color screen that is visible in all lighting conditions and helps the tester visualize dynamic pile-monitoring and dynamic load-testing data. A built-in CD writer eases data storage for later processing and analysis. Software improvements include a new version of the PDILOT program that produces report-quality graphs and tables of results. Also included is the latest version of PDA-W data processing and analysis with help files that include updates and explanations of new functions; and the ability to estimate the pile resistance distribution and tension envelope in the field, giving the user much needed insights in real time.
